FOREWORD

The Public Works and Economic Development Act provides important tools to augment the self-help efforts of areas suffering from chronic unemployment or underemployment.

To stimulate economic growth and to help create new job opportunities in these areas, the Act provides:

- Loans to new or expanding industries;
- Loans and grants to communities for public facilities that are vital if new firms are to get started or existing ones are to expand;
- Technical assistance to help find answers to long-standing economic problems.

Before a redevelopment area can take advantage of these Federal aids, it needs to know where it's going and how it plans to get there.

This publication was prepared to help local economic development groups and others concerned with economic development in their efforts to locate and attract new and expanding industry. The growth characteristics of manufacturing industries provided in this booklet will permit a concentration of these efforts on those industries having the greatest economic development potential.

A handwritten signature in black ink, reading "Robert A. Podesta". The signature is fluid and cursive, with a large initial "R" and a stylized "P".

INTRODUCTION

This study is designed as a technical tool and research aid for those working in the industrial development field. Specifically, the study lists manufacturing industries ranked by growth trend and provides supporting information on labor characteristics. Its purpose is to provide a starting point for individuals and agencies in their efforts to locate and attract new industry to redevelopment areas.

While the study responds to a wide variety of questions, the following probably represent those of greatest interest to area redevelopment officials:

- Which industries show growth potential and, therefore, present industrial development opportunities?
- Which industries are declining, or have shrunk substantially from previous peaks, and, therefore, may be troubled by excess production capacity?
- Within a particular industrial category, which industries have the greatest, or least, growth potential?
- Does industry A or industry B have the better growth record?
- How does a particular industry rank in its investment in plant and equipment?
- Which industries are likely to place greatest emphasis on low wage labor? On an abundance of production type workers?
- What is the size of a given industry (or product class) as represented by value of shipments?

The primary emphasis of this study, then, is (1) on industry growth characteristics, because the growing industries are those which will be locating new plants, and (2) on labor characteristics, because those industries that will effectively employ surplus labor are the prime focus of area development activity.

The substance of the study is presented in three tables and attendant explanations. Complete reading of the explanatory material with each table is necessary for effective use of the study.

TABLE I

Growth and Labor Characteristics of Selected Manufacturing Industries

DESCRIPTION OF CONTENTS

The 411 manufacturing industries in Table I of this study are those with four-digit Standard Industrial Classification (SIC) codes. SIC codes refer to the breakdown of industry into major categories and several stages of subcategories, as defined by the Executive Office of the President, Office of Management and Budget, and as used by the Bureau of the Census. The level of manufacturing industry detail ranges from two-digit codes (major industry groups) to seven-digit codes (products). For example:

<i>Industry breakdown</i>		<i>Industry product, etc.</i>
Major industry group	20	Food and kindred products
Industry group	203	Canned and frozen foods
Industry	2033	Fruits and vegetables, etc.
Product class	20331	Fruits
Product	2033113	Applesauce

The Table I industries are rated for growth trends, recent and long-term; the year of peak employment during the 1953-67 period; the percentage decline, if any, from the peak employment year to 1967; capital formation or the relative growth in investment for plant and equipment; and three labor characteristics: average wage rate for production workers, blue collar workers as a percentage of total employment, and labor intensity (production workers wages as a percentage of value added by manufacture).

The industries are grouped in categories according to their recent growth trend—1958 through 1967. The long term trend—1958 versus 1967—is also listed and can be used for comparative purposes. Industries whose data show a sharp contrast between the recent trend and the longer term trend may need more extensive investigation. It is probable, however, that the 1958-67 trend will be the more significant of the two.

Within the growth categories, the industries are listed by SIC code order. In this way, the Table I listing permits quick selection of the top growth industries in each major industry group. For example, the top growth industries among the Food and kindred products industries (SIC 20) are Frozen fruits and vegetables (SIC 2037), which falls in

the Very High Growth (VHG) category, and two other industries, Dehydrated food products (SIC 2034) and Blended and prepared flour (SIC 2045), which fall in the High Growth (HG) category.

For quick reference, the two-digit SIC codes for major industry groups are as follows:

<i>SIC</i>	<i>Industry Group</i>	<i>SIC</i>	<i>Industry Group</i>
20	Food and kindred products	31	Leather and leather products
21	Tobacco manufactures	32	Stone, clay, and glass products
22	Textile mill products	33	Primary metal industries
23	Apparel and related products	34	Fabricated metal products
24	Lumber and wood products	35	Machinery, except electrical
25	Furniture and fixtures	36	Electrical machinery
26	Paper and allied products	37	Transportation equipment
27	Printing and publishing	38	Instruments and related products
28	Chemicals and allied products	39	Miscellaneous manufacturing
29	Petroleum and coal products		
30	Rubber and plastics products, n.e.c.		

Criteria used and key to symbols

The informational key to each of the columns in Table I and the symbols used are as follows:

Table stub:

1. The SIC code identification of industries.
2. List of industries identified by short descriptive title and grouped by growth categories developed by comparison of average annual employment in the 1958-60 period and the average for 1966-67. The growth categories are as follows:

VERY HIGH GROWTH (VHG): 1966-67 average annual employment versus 1958-60 equals 50-percent gain or better. In other words, average employment for the 2-year period 1966-67 exceeds the average employment for the 3-year period 1958-60 by 50 percent or more. Includes 40 industries.

HIGH GROWTH (HG): 1966-67 average annual employment versus 1958-60 equals 30-percent to 50-percent gain. Includes 59 industries.

MODERATE GROWTH (MG): 1966-67 average annual employment versus 1958-60 equals 10-percent to 30-percent gain. Includes 134 industries.

STATIC (S): average annual employment in 1966-67 rose above 1958-60 by less than 10 percent. Includes 58 industries.

DECLINING (D): average annual employment in 1966-67 declined from the 1958-60 average. Includes 120 industries, 70 of which declined by less than 15 percent and 50 of which declined by more than 15 percent.

Column Headings

Column (1)—1967 Employment Relative to Peak Year. The peak year for total employment in each industry and the percentage, if any, by which 1967 employment has shrunk from the peak year. The column attempts to provide a rough indication of the amount of excess productive capacity, if any, in a particular industry. This is based on the assumption that the various industries were operating at or near capacity in the peak year, and that any decline from the peak year would indicate the existence of excess production capacity in the industry. The validity of this assumption is reduced by the spread in time between 1967 and the peak year, since the nature or size of an industry's production capacity will change with the gradual abandonment and/or construction of production facilities. On the other hand, a decline from a recent peak year may be of a cyclical or temporary nature.

All of the industries listed as having "Very High Growth" had their peak year in 1967, whereas most of the "Static" and "Decline" industries peaked much earlier.

In summary, 137 industries (33 percent of the total number) reached their employment peak in 1967; 110 industries (27 percent) declined between zero and 10 percent from the peak year; 65 industries (16 percent) declined 10-20 percent; 50 industries (12 percent) declined 20-30 percent; 23 industries (6 percent) declined 30-40 percent; and 26 industries (6 percent) declined over 40 percent. On a cumulative basis, 33 percent of the industries declined not at all, 60 percent declined less than 10 percent, 76 percent declined less than 20 percent, 88 percent declined less than 30 percent, and 94 percent declined less than 40 percent.

Peak years were determined from among those years back through 1953 for which data were available. Peak employment was reached in 1967 by 137 industries, in 1966 by 82, and in 1953 by 53. The remaining 139 industries reached their peak, as many as 24 in 1956 or as few as 2 in 1961, during the 12-year period from 1954-65.

Column (2)—Long Term Growth Trend. Symbols in this column measure growth based on the ratio of the industry's 1967 value added by manufacture to its 1958 value added as related to the all manufacturing industry average. The key to the symbols used is as follows:

VHG: Very high growth, 1967/1958 ratio exceeds 130 percent of

that for all manufacturing. Includes 47 industries.

HG: High growth, 1967/1958 ratio equals 110 percent to 130 percent of that for all manufacturing. Includes 73 industries.

MG: Moderate growth, 1967/1958 ratio equals 90 percent to 110 percent of that for all manufacturing. Includes 110 industries.

S: Static, 1967/1958 ratio equals 70 percent to 90 percent of that for all manufacturing. Includes 119 industries.

D: Declining, 1967/1958 ratio is less than 70 percent of that for all manufacturing. Includes 61 industries.

Since the symbols describe trends computed by comparing only two points in time, 1958 and 1967, the long term rating may be affected unduly by annual production variations, industry to industry. The trend based on the average annual employment in 1958-60 compared with 1966-67 may on the whole be a more valid indicator of industry growth potential.

Column (3)—Capital Formation. This indicator compares an industry's total gross value of depreciable assets (plant and equipment) at the end of 1963 and 1967, and on a relative basis provides a comparison of one industry with another. The underlying data represent the actual cost of the assets at the time they were acquired. Whenever a plant changes ownership, however, the new owner typically uses an appraised or purchase value. In industries where there have been numerous changes of ownership, the value of the assets may have dropped off substantially. Declining valuation, therefore, to some extent might be the result of accounting practices. On the other hand, the underlying values represent book value (original cost) of fixed assets, and a substantial increase in the data reported for an industry would indicate a major increment of growth in facilities for manufacturing. The data on book value are secured by sampling manufacturing establishments and, at times, may be subject to high sampling variation which, if excessive, leads to withholding of the information. The key to the symbols used to show changes from 1963 to 1967 are as follows:

VH: Very high additional investment in plant and equipment, roughly 85.0 percent or more above the 1963 aggregate book value, by 25 industries.

H: High additional investment over 1963, between 50.0 and 84.9 percent, by 94 industries.

M: Moderate additional investment over 1963, from 25.0 to 49.9 percent, by 150 industries.

L: Low additional investment over 1963, between zero and 24.9 percent, by 87 industries.

VL: Very low or negative investment, from 1963 to 1967, by 28 industries.

Column (4)—Average Wage Rate. This provides a rough indication of the skill levels required of production workers in the industry. An indication of lower skill levels may be important to a community development group whose main objective is to reduce unemployment among a large pool of lesser skilled individuals. On the other hand, an area in which wage rates and skills are above average likely would assemble its list of prospective industries from those that pay high wages. Symbols in this column represent categories based on 1967 annual wage for production workers divided by total hours worked. The key to the symbols used is as follows:

VH: Very high wages, over \$3.75 per hour. Includes 18 industries.

H: High wages, \$3.25 to \$3.74 per hour. Includes 76 industries.

M: Moderate wages, \$2.50 to \$3.24 per hour. Includes 175 industries.

L: Low wages, \$2.00 to \$2.49 per hour. Includes 98 industries.

VL: Very low wages, under \$2.00 per hour. Includes 44 industries.

Column (5)—Percent Blue Collar. This indicates the importance of production workers relative to managerial, professional, technical, and clerical employees. Industries with a relatively low percentage of blue collar workers will have a correspondingly high proportion of employees of the type that demand superior community amenities and services, such as education, recreation, health, and transportation facilities. High blue collar percentages may indicate industries that are more interested in a large labor supply. Symbols in this column represent categories based on production workers as a percent total employment in 1967. The key to the symbols is as follows:

VH: Very high, 90 percent or more. Includes 36 industries.

H: High, 85-89 percent. Includes 78 industries.

M: Moderate, 70-84 percent. Includes 216 industries.

L: Low, 55-69 percent. Includes 69 industries.

VL: Very low, under 55 percent. Includes 12 industries.

Column (6)—Labor Intensity. This is an indication of the overall importance of labor to a particular industry. Industries whose labor costs are high relative to their total costs will normally have an intense interest in the labor factor as a locational determinant. Whether this type of industry can be attracted to a particular community will depend upon whether its requirements for labor are white collar or blue collar, high skill production or low skill production. All of the labor factors, therefore, should be considered by an economic development group in targeting its efforts toward a select list of industries. (An example

of one such list is Table III.) Symbols in this column represent categories based on production worker wages as a percent of value added by manufacture in 1967. The key to the symbols is as follows:

VH: Very high, over 50 percent. Includes 15 industries.

H: High, 40-50 percent. Includes 101 industries.

M: Moderate, 25-40 percent. Includes 213 industries.

L: Low, 15-25 percent. Includes 62 industries.

VL: Very low, under 15 percent. Includes 20 industries.

SPECIAL COMMENT

In summary, the criteria used in the tables to describe growth characteristics have proved satisfactory for most of the industries. However, no single criterion for growth can accurately characterize all industries, since the trends in various economic sectors are often divergent. Homebuilding activity during the 1958-62 period was in an extended downtrend, thereby affecting the need for building products as a whole. Out of 24 industries readily identifiable as in building and related products, only one each then was in the VH and HG groups, 4 were in MG, 14 were in S, and 4 were rated D. Industries in this group as of 1967, broadly speaking, were still on the downgrade, with 17 in 1967 in the static or declining category compared with 18 back in 1962. However, in 1967 a larger number, 12, were classified as declining, whereas only 4 were in decline in 1962. In terms of 1967 dollars, or in constant dollars, the volume of residential construction, a major consumer of building products, averaged in 1961-62 just about the same as the average for 1958-60. By 1969-70, however, though still 3.5 percent down from the 1958-60 level, homebuilding construction was better off, and current forecasts for the 1970's indicate strong expansionary growth, not only in homebuilding, but in most other sectors of the economy.

TABLE II

Volume of Shipments and Growth Characteristics of Selected Industries and Product Classes

DESCRIPTION OF CONTENTS

The information in Table II augments that in Table I, presenting growth and value of shipments data for the 411 industries (four-digit SIC code) and for 1,110 product classes (five-digit SIC code) for the 1964/65-1967/68 period. The inclusion of product classes provides growth categorization at a finer level of industrial detail than exists in Table I.

Industries that appear to have merit based on information in Table I should be checked against Table II to determine that part of the industry (if there is more than one part) having the greatest growth potential, and to determine the industry's or product class's relative size based on value of shipments. An extremely small industry or product class will have relatively little area development potential despite its rising trend. Conversely, a large industry that is declining may likewise offer very little developmental aid.

The listing of Table II industries by order of Standard Industrial Classification (SIC) also affords the user the means conveniently to cross-check on a particular industry for reference to the labor information shown in Table I, through use of the growth-category symbol.

Criteria used and key to symbols

The 411 industries (four-digit SIC code) and 1,110 product classes (five-digit SIC code) are listed in their Standard Industrial Classification code order. The volume of shipments is stated for 1968.

Industry (four-digit) growth categories are identical with the growth categories in Table I.

Product class (five-digit) growth categories, however, are based on trends in value of shipments as follows:

VHG: Very High Growth, 1967-68 average annual value of shipments versus 1964-65 equals 150 percent gain or better. Includes 118 product classes.

HG: High Growth, 1967-68 average annual value of shipments versus 1964-65 equals 40-150 percent gain. Includes 209 product classes.

MG: Moderate Growth, 1967-68 average annual value of shipments versus 1964-65 equals 10-40 percent gain. Includes 459 product classes.

S: Static, 1967-68 average annual value of shipments versus 1964-65 equals 4.9-percent decline to 10-percent gain. Includes 196 product classes.

D: Declining, 1967-68 average annual value of shipments versus 1964-65 equals 5 percent and greater decline. Includes 128 product classes.

Since industry (four-digit) growth trend rankings are based on employment data for the periods 1958-60 and 1966-67 whereas product class growth trends are based entirely on value of shipments (which is affected by price volatility) during a shorter and somewhat different time period, there are apparent differences between the industry growth rank and the ranks of the industry's product class components. The employment concept used for the industries is considered the more reliable growth indicator, but employment data are not available for product classes on a historical basis.

n.e.c. = not elsewhere classified

n.s.k. = not specified by kind

NA = not available

(D) = Withheld to avoid disclosing figures for individual companies.

(S) = Census estimate withheld as not meeting publication standards.

General note: Figures shown for 1968 value of shipments are based on the *Annual Survey of Manufactures, 1968*, "Value of Shipments by Classes of Products," M68(AS)-2; and upon the 1967 *Census of Manufactures*. In a number of instances the 1968 values are preliminary and, for a small number of cases, have been estimated on the basis of related data.

TABLE III

Example of Table I Data Use, List of Growth Industries With Selected Characteristics

DESCRIPTION OF CONTENTS

Table III is an example of one use of the basic Table I information. It lists 74 industries (selected from Table I) having five characteristics in common: a moderate or better growth trend, a moderate to very low capital investment, a moderate to very low average wage rate, a moderate to very high percentage of blue collar workers, and a moderate to very high labor intensity.

Industries having these five characteristics in common probably have a high potential for area development, since their locational requirements normally place considerable emphasis on the availability of an abundance of blue collar type labor. In addition, some communities will be interested in industry wage rates as an indicator of the degree of skills demanded by the industry.

As stated before, Table III is merely an example of a use of the data in Table I. Many other select lists of industries can be constructed by scanning Table I data symbols or a combination of symbols.

Criteria used and key to symbols

Table III is a list of industries with five characteristics in common based on information shown in Table I:

- (1) a moderate or better growth trend, symbols MG, HG, VHG;
- (2) a moderate to very low capital investment, symbols M, L, VL;
- (3) a moderate to very low average wage rate, symbols M, L, or VL;
- (4) a moderate to very high percentage of blue collar workers, symbols M, H, VH; and
- (5) a moderate to very high labor intensity (production worker wages as a percentage of value added), symbols M, H, or VH.

The columns show the SIC code, the number of employees, since labor characteristics make up the main basis for this table, and the Table I growth category.
